

Notes of a Phone Call
From P. J. Raleigh
Re Pilot Plant Work
August 16, 1979

Raleigh feels the quality of the product being produced is okay and will be saleable. With reference to the Con material, he feels that we may have a bad sample and that we should probably be going after more samples to make sure it is representative.

He stated that he would be meeting the Strother-Wells people next week to start working towards equipment purchases and design of buildings.

I covered the news article in the News of the North and WAM's reply. Raleigh felt from a corporate point of view we shouldn't be giving a press conference yet but could make some comment on the potential for sale of an upgraded product that would be of an advantage to the community. He felt that a press conference might affect things adversely. He suggested instead that we put out an article for the papers as an information item. This could be worked up between him and Herb Hickey.

He briefly discussed the HSA reactor. The secrecy document has now been revised and Cooper has approved the use of the word parent. Bergman and Barrie are to see and approve the final version before it can be signed. I suggested that he try to get the unit shipped up even before the agreement was signed with the understanding that it wouldn't be uncrated. Raleigh had tried this with no success but would try to go at it again. He also stated that he would have the Kooper's agreement in order for me to sign on my next trip.

D. J. Emery
