

## **Baghouse Monitoring**

- 1) The baghouse is inspected (all eight compartments) every second month. Operators perform the following tasks:

- Vacuum between the bags
- Remove any damaged bags (tie them off)
- Do minor mechanical repairs
- Inspect bearings and grease lines

This inspection is performed by two mill operators (Cottrell Operators) who routinely work in the Cottrell/Baghouse area.

- 2) Each baghouse compartment is completely overhauled every eighteen months. Internal mechanisms are replaced with new or refurbished equipments. All new bags (300) are installed.
- 3) Operators in the Cottrell/Baghouse area submit to urine samples quarterly for As analysis.
