Subject Tailings Dam #11 - Your Memo of 28 May 1984.....

7 JUN 84 9:00
I have reviewed the progress and the concerns related to construction of this dam (#11 - New South Dam). We have made a decision to continue with the construction according to the recommendations made initially by Geocon and as constructed in 1983.

During the winter stripping of the G-Crown, we exposed a large quantity of good quality clay from beneath the creek bed and we have located a reasonably good sand borrow pit near the Akaitcho site. We think we will have enough suitable material to complete the project.

We have continued to bed the inside of the dyke with tailings over the past winter and now feel quite confident that we can achieve a sound, water-tight structure.

For now at least, we do not feel it is appropriate to consider redesigning the dam.
