**Giant Mine Exploration Assistance Program
Third Quarter Report
Period ending June 30th, 1999**

**Timothy W. Canam P. Geol
Chief Mine Geologist
Giant Mine**

**RWED LIBRARY
GOVT OF THE NWT
YELLOWKNIFE**

Summary

All exploration programs continued during the third quarter of the Exploration Assistance Program with the surplus funding remaining from the first and second quarters. Advance was continued until most of the surplus funds were consumed. With the third quarter funding withheld, it was decided to terminate development in the 3-70, 7-80 and 1500 exploration drifts and use the remaining funding for diamond drilling. The 7-80 exploration drift continued as an operational expense to Giant and was completed at the end of June.

Diamond drilling began late April in the 3-70 and 1500 level drifts and continued through the end of May. Diamond drilling continues at this time in the 3-70 program; three holes were drilled from the 1500 level drift, two to the east to the alteration zone and one to the west.

A total of 4,768 feet was drilled in the 3-70 exploration drift and expensed to GNWT exploration assistance program. A total of 2,295 feet was drilled on 1500 level, the two holes to the east were expensed to the GNWT exploration program. The hole drilled to the west is not included in the footage and was expensed to the Giant mine operation.

At the end of May 1999 the funding received from the Government of the Northwest Territories; a total of \$771,250 has been spent in carrying out the exploration program.

The suspension of the Exploration Assistance program could not have come at a worse time. With the gold price at a 20 year low, the Giant mine is not able to fund the continuation of the 1500 level exploration program or any deep exploratory drilling below the 2000 level. As a result the mid term future is in doubt and the exploration potential of the mine will not be realized.

Third Quarter Results

The lineal advance from the three development headings was 216 feet; total diamond drilling was 7,063 feet. Expenditures during the third quarter were \$131,930.41. This represents the balance of funding remaining at the end the 2nd quarter.

1500 Level Exploration

The drift advanced 93 lineal feet during the third quarter. Total advance of the drift was 722 feet. Approximately 553 feet of the proposed drift remain to be driven. Diamond drilling to test the Lower East zone commenced during late April. One section was drilled with 2 holes to the east and one to the west. The alteration zone to the east was intersected in the area expected. Generally, the alteration zone was moderately to strongly sericitized and carbonatized. The high carbonate content was not encouraging. There were localized sections of silicification; in these areas the alteration zone was weakly mineralized with pyrite and very fine grained arsenopyrite, but failed to return any significant assays.

The drill hole to the west did not intersect an alteration zone. However, it did return an intersection of 0.811/1.7 feet approximately 500 feet west of the drift. This intersection was essentially a quartz vein with a few specks of visible gold. Sulphides in the quartz were rare. This intersection requires fill in drilling which, when time and scheduling allows, will be done.

SuperCrest 3-70 Exploration

The 3-70 program advanced 38 feet in April; this completed the development in the north end of the 3-70 Exploration drift. A diamond drill unit moved into the drift and commenced drilling operations during April and continued into May. Initial drill spacing is on 100 foot centres, with any follow-up drilling to be on 50 or 25 foot centres. A summary of results to the end of June 1999 is attached, but sections are not available at this time. Since further funding was withheld and these are tough economic times, additional geologists were not hired to handle the additional core. All work is being done with available Giant mine geology staff.

SuperCrest 750 Exploration

The total advance for the 780 N. Dr to the end of April was 609 feet. In May and June the drift advanced another 396 feet to completion; this was expensed to the mine operations. Diamond drilling is expected to begin in mid July 1999.

For diamond drill holes expensed to the GNWT exploration assistance program, sampling of the drill core involved cutting the core in half with one half going to the assay laboratory, and the other half being retained in the core box. Generally, only the core near the alteration zone hosting the ore lenses was saved. One or two complete holes were saved. In order to continue the diamond drilling, it was necessary to recycle the core boxes. Financial constraints prevented the purchase of additional core boxes. Assaying of the core was done at the Giant mine assay laboratory by atomic absorption; occasional checks were done by fire assay on selected samples or on some with AA results greater than one ounce per ton.

For the holes drilled from 1500 level, representative samples were collected and recorded prior to discarding the core. Sample interval was variable depending on the variability of the lithologies within the holes.
