

Notes of a Meeting
With H. T. Evans
July 2, 1979

Mr. Evans dropped by to say that we should be considering a 2½% ammonia solution rather than the 12% as suggested by Koppers to help in the dissolution and crystallization of arsenic. He feels the lower content of ammonia will do the trick.

He also was of the opinion that we are under no obligation to Koppers for the ammonia process, as it was well known and written up as indicated in his earlier memo to me.
