Request For Information On Stack Parameters For The Modelling Of Emissions

The National Emissions Inventory and Forecasting Task Group of the National Air Issues Coordinating Committee is responsible for the development of nationally consistent methodologies and procedures for the timely preparation of emissions inventories and forecasts.

On behalf of this task group Environment Canada is managing the contract with Chemical Emission Management Services, to collect the detailed stack parameters which are required as input for various emission dispersion models. These federal and provincial models are an important part of our studies of the environment, and support a number of domestic and international programs such as Acid Rain, SMOG, and the Canada-US Air Quality Accord.

Under this contract Chemical Emission Management Services is required to contact a number of industries across Canada, to obtain specific stack information.

Your collaboration on this information gathering effort would be greatly appreciated. If you need further information about this request for information you can contact Chemical Emission Management Services at (905) 820-6126.

Sincerely,

Marc Deslauriers
